

Lesson 12

Persistence: Files & Preferences

Victor Matos

Cleveland State University

Android Files

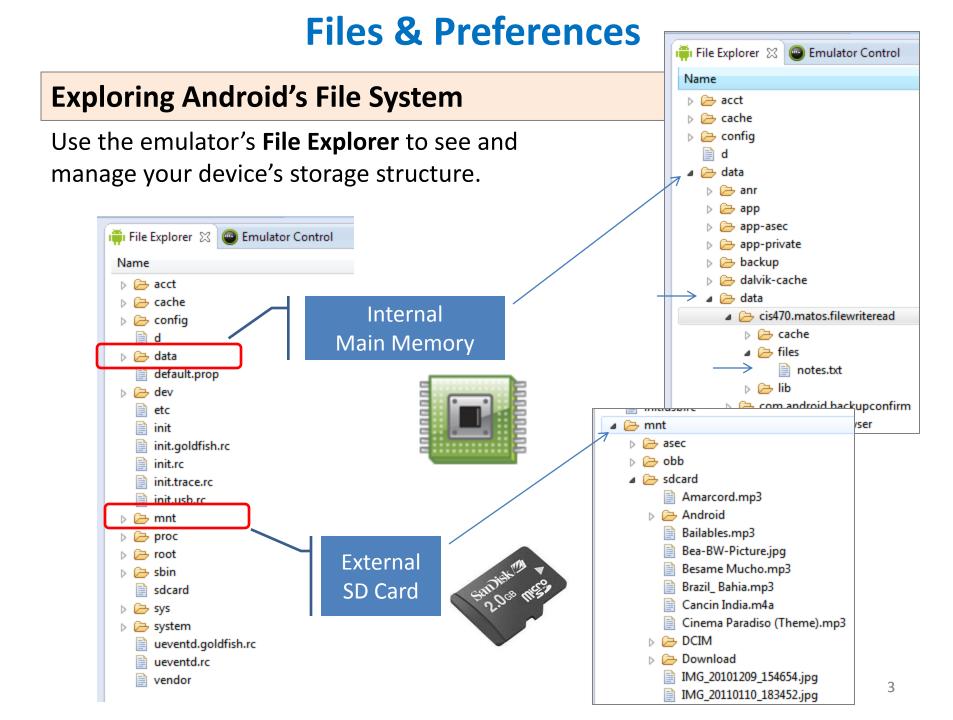

Persistence is a strategy that allows the reusing of volatile objects and other data items by storing them Into a permanent storage system such as disk files and databases.

File IO management in Android includes –among others- the familiar IO Java classes: Streams, Scanner, PrintWriter, and so on.

Permanent files can be stored *internally* in the device's main memory (usually small, but not volatile) or *externally* in the much larger SD card.

Files stored in the device's memory, share space with other application's resources such as code, icons, pictures, music, etc.

Internal files are called: Resource Files or Embedded Files.

Choosing a Persistent Environment

Your permanent data storage destination is usually determined by parameters such as:

- size (small/large),
- location (internal/external),
- accessibility (private/public).

Depending of your situation the following options are available:

- 1. Shared Preferences Store private primitive data in key-value pairs.
- 2. Internal Storage Store private data on the device's main memory.
- **3. External Storage** Store public data on the shared external storage.
- 4. SQLite Databases Store structured data in a private/public database.
- 5. Network Connection Store data on the web.

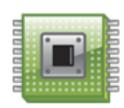

Shared Preferences

SharedPreferences files are good for handling a handful of Items. Data in this type of container is saved as **Key, Value** pairs where the *key* is a string and its associated *value* must be a primitive data type.

This class is functionally similar to Java Maps, however; unlike Maps they are *permanent*.

Data is stored in the device's internal main memory.

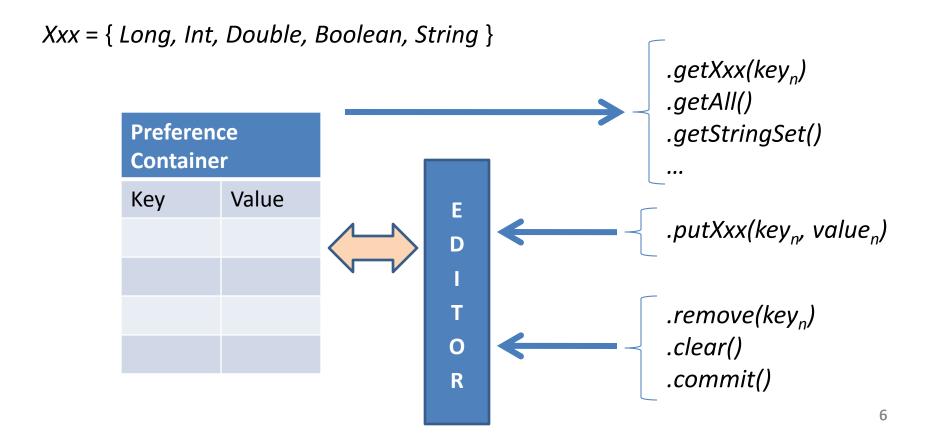

PREFERENCES are typically used to keep state information and shared data among several activities of an application.

Shared Preferences

Using Preferences API calls

Each of the Preference mutator methods carries a typed-value content that can be manipulated by an *editor* that allows *putXxx...* and *getXxx...* commands to place data in and out of the Preference container.

Example. Shared Preferences

In this example the user selects a preferred 'color' and 'number'. Both values are stored in a SharedPreferences file.

Key	Value
chosenColor	RED
chosenNumber	7

```
private void usingPreferences(){
  // Save data in a SharedPreferences container
 // We need an Editor object to make preference changes.
 SharedPreferences myPrefs = getSharedPreferences("my_preferred_choices",
                                                    Activity. MODE PRIVATE);
 SharedPreferences.Editor editor = myPrefs.edit();
          editor.putString("chosenColor", "RED");
          editor.putInt("chosenNumber", 7 );
 editor.commit();
  // retrieving data from SharedPreferences container (apply default if needed)
 String favoriteColor = myPrefs.getString("chosenColor", "BLACK");
  int favoriteNumber = myPrefs.getInt("chosenNumber", 11 );
```

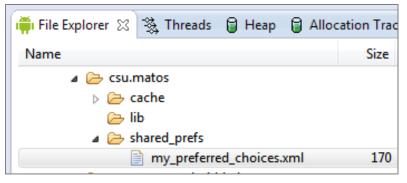

Shared Preferences. Example - Comments

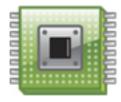

- 1. The method getSharedPreferences (...) creates (or retrieves) a table called my_preferred_choices file, using the default MODE_PRIVATE access. Under this access mode only the calling application can operate on the file.
- 2. A SharedPreferences editor is needed to make any changes on the file. For instance editor.putString("chosenColor", "RED") creates(or updates) the key "chosenColor" and assigns to it the value "RED". All editing actions must be explicitly committed for the file to be updated.
- 3. The method **getXXX(...)** is used to extract a value for a given key. If no key exists for the supplied name, the method uses the designated default value. For instance myPrefs.getString("chosenColor", "BLACK") looks into the file *myPrefs* for the key "chosenColor" to returns its value, however if the key is not found it returns the default value "BLACK".

Shared Preferences. Example - Comments

SharedPreference containers are saved as XML files in the application's internal memory space. The path to a preference files is /data/data/packageName/shared_prefs/filename.

For instance in this example we have:

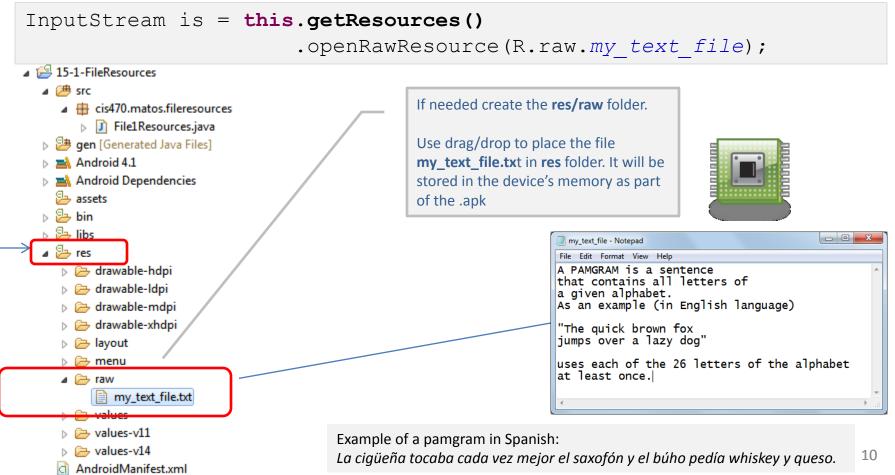

If you pull the file from the device, you will see the following

Internal Storage. Reading an Internal Resource File

An Android application may include resource elements such as those in:

res/drawable, res/raw, res/menu, res/style, etc.

Resources could be accessed through the **.getResources(...)** method. The method's argument is the ID assigned by Android to the element in the R resource file. For example:

Example 1. Reading an Internal Resource File

1 of 2

Files1Resources

A PAMGRAM is a sentence.

This app stores a text file in its RESOURCE (**res/raw**) folder. The embedded raw data (containing a *pamgram*) is read and displayed in a text box (see previous image)

}//onCreate

```
that contains all letters of
//reading an embedded RAW data file
                                                                    a given alphabet.
                                                                    As an example (in English language)
public class File1Resources extends Activity {
                                                                    "The quick brown fox
  TextView txtMsg;
                                                                    jumps over a lazy dog"
  @Override
                                                                    uses each of the 26 letters of the
                                                                    alphabet
  public void onCreate(Bundle savedInstanceState) {
                                                                    at least once.
      super.onCreate(savedInstanceState);
      setContentView(R.layout.main);
     txtMsg = (TextView) findViewById(R.id.textView1);
     try {
        PlayWithRawFiles();
      } catch (IOException e) {
         txtMsg.setText( "Problems: " + e.getMessage() );
```

Example 1. Reading an Internal Resource File

2 of 2

Reading an embedded file containing lines of text.

```
public void PlayWithRawFiles() throws IOException {
   String str="";
   StringBuffer buf = new StringBuffer();
int fileResourceId = R.raw.my_text_file;
   InputStream is = this.getResources().openRawResource(fileResourceId);
BufferedReader reader = new BufferedReader(new
                               InputStreamReader(is) );
   if (is!=null) {
    while ((str = reader.readLine()) != null) {
        buf.append(str + "\n" );
   reader.close();
   is.close();
   txtMsg.setText( buf.toString() );
 }// PlayWithRawFiles
} // File1Resources
```

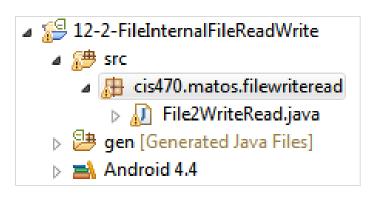

Example1 - Comments

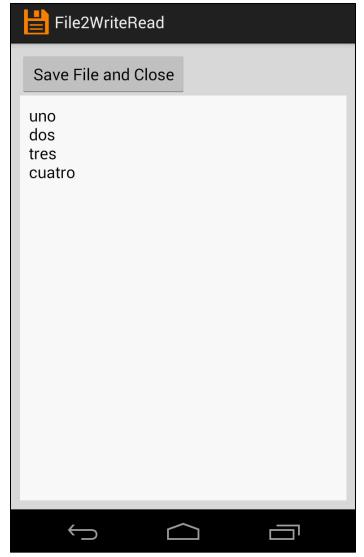

- A raw file is an arbitrary dataset stored in its original raw format (such as .docx, pdf, gif, jpeg, etc). Raw files can be accessed through an InputStream acting on a R.raw.filename resource entity.
 CAUTION: Android requires resource file names to be in lowercase form.
- The expression getResources().openRawResource(fileResourceId)
 creates an InputStream object that sends the bytes from the selected
 resource file to an input buffer. If the resource file is not found it raises a
 NotFoundException condition.
- 3. A *BufferedReader* object is responsible for extracting lines from the input buffer and assembling a string which finally will be shown to the user in a textbox. Protocol expects that conventional IO housekeeping operations should be issued to close the reader and stream objects.

Example 2. Reading /Writing an Internal Resource File 1 of 6

In this example an application exposes a GUI on which the user enters a few lines of data. The app collects the input lines and writes them to a persistent internal data file.

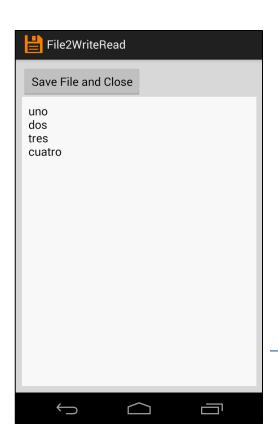

Next time the application is executed the *Resource File* will be **read** and its data will be shown on the UI.

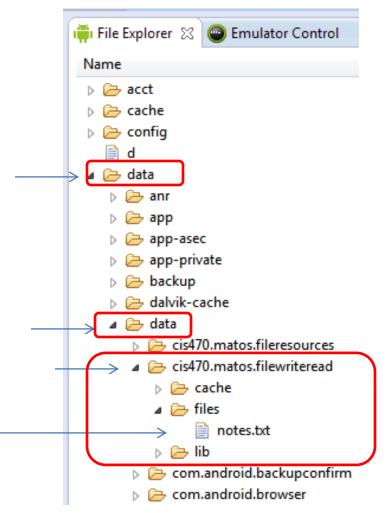

Example 2. Reading /Writing an Internal Resource File 2 of 6

The internal resource file (notes.txt) is private and cannot be seen by other apps residing in main memory.

In our example the files **notes.txt** is stored in the phone's internal memory under the name:

/data/data/cis470.matos.fileresources/files/notes.txt

Example 2. Reading / Writing an Internal Resource File 3 of 6

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"</pre>
    android:layout width="match parent"
                                                                File2WriteRead
    android:layout height="match parent"
                                                               Save File and Close
    android:background="#ffdddddd"
    android:padding="10dp"
                                                               uno
    android:orientation="vertical" >
                                                               dos
                                                               tres
                                                               cuatro
    <Button android:id="@+id/btnFinish"
        android:layout width="wrap content"
        android:layout height="wrap content"
         android:padding="10dp"
        android:text=" Save File and Close " />
    <EditText
        android:id="@+id/txtMsq"
        android:layout width="match parent"
        android:layout_height="match_parent"
        android:padding="10dp"
        android:background="#fffffff"
        android:gravity="top"
        android:hint="Enter some lines of data here..." />
</LinearLayout>
```

Example 2. Reading / Writing an Internal Resource File 4 of 6

```
public class File2WriteRead extends Activity {
  private final static String FILE NAME = "notes.txt";
  private EditText txtMsg;
  @Override
  public void onCreate(Bundle icicle) {
     super.onCreate(icicle);
     setContentView(R.layout.main);
     txtMsg = (EditText) findViewById(R.id.txtMsg);
     // deleteFile(); //keep for debugging
     Button btnFinish = (Button) findViewById(R.id.btnFinish);
     btnFinish.setOnClickListener(new Button.OnClickListener() {
        public void onClick(View v) {
           finish();
     });
  }// onCreate
```

Example 2. Reading /Writing an Internal Resource File 5 of 6

```
public void onStart() {
 super.onStart();
 try {
   InputStream inputStream = openFileInput(FILE NAME);
   if (inputStream != null) {
     BufferedReader reader = new BufferedReader(new
                                  InputStreamReader(inputStream));
     String str = "";
     StringBuffer stringBuffer = new StringBuffer();
     while ((str = reader.readLine()) != null) {
       stringBuffer.append(str + "\n");
     inputStream.close();
     txtMsg.setText(stringBuffer.toString());
 catch ( Exception ex ) {
   Toast.makeText(CONTEXT, ex.getMessage() , 1).show();
}// onStart
                                                                                18
```

Example 2. Reading /Writing an Internal Resource File 6 of 6

```
private void deleteFile() {
    String path = "/data/data/cis470.matos.filewriteread/files/" + FILE_NAME;
    File f1 = new File(path);
    Toast.makeText(getApplicationContext(), "Exists?" + f1.exists() , 1).show();
    boolean success = f1.delete();
    if (!success){
        Toast.makeText(getApplicationContext(), "Delete op. failed.", 1).show();
    }else{
        Toast.makeText(getApplicationContext(), "File deleted.", 1).show();
    }
}
```

Example2 - Comments

- 1. The expression openFileInput(FILE_NAME) opens a private file linked to this Context's application package for reading. This is an alternative to the method getResources().openRawResource(fileResourceId) discussed in the previous example.
- 2. A *BufferedReader* object moves data line by line from the input file to a textbox. After the buffer is emptied the data sources are closed.
- 3. An OutputStreamWriter takes the data entered by the user and send this stream to an internal file. The method openFileOutput() opens a private file for writing and creates the file if it doesn't already exist. The file's path is: /data/data/packageName/FileName
- 4. You may delete an existing resource file using conventional .delete() method.

Reading / Writing External SD Files

SD cards offer the advantage of a *much* larger capacity as well as portability.

Many devices allow SD cards to be easily removed and reused in another device.

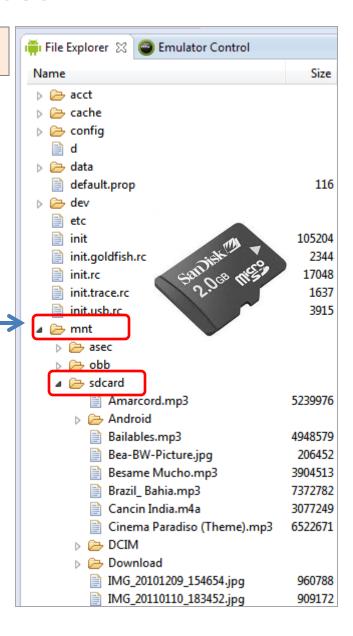

SD cards are ideal for keeping your collection of music, picture, ebooks, and video files.

Reading / Writing External SD Files

Use the **File Explorer** tool to locate files in your device (or emulator).

Look into the folder: **mnt/sdcard/** there you typically keep music, pictures, videos, etc.

Reading / Writing External SD Files

Although you may use the specific path to an SD file, such as:

mnt/sdcard/mysdfile.txt

it is a better practice to determine the SD location as suggested below

```
String sdPath = Environment.getExternalStorageDirectory().getAbsolutePath();
```

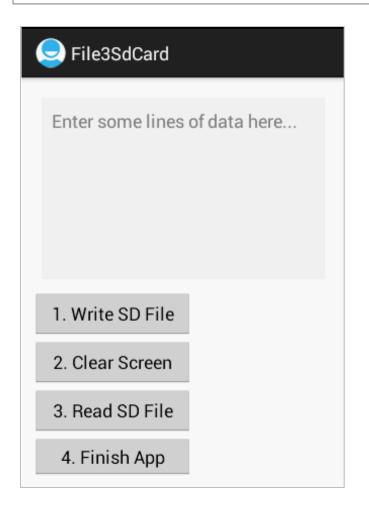

WARNING

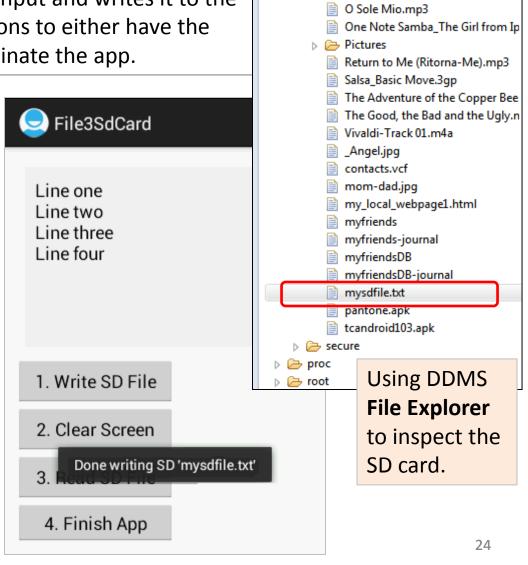

When you deal with external files you need to request permission to read and write to the SD card. Add the following clauses to your AndroidManifest.xml

```
<uses-permission android:name="android.permission.READ_EXTERNAL_STORAGE"/>
<uses-permission android:name="android.permission.WRITE_EXTERNAL_STORAGE"/>
```

Example 3. Reading / Writing External SD Files

This app accepts a few lines of user input and writes it to the external SD card. User clicks on buttons to either have the data read and brought back, or terminate the app.

Name

i File Explorer 🛭 📵 Emulator Control

Mi Tierra.mp3

New York, New York.mp3

Example 3. Reading / Writing External SD Files

Enter some lines of data here...

File3SdCard

Layout

```
<?xml version="1.0" encoding="utf-8"?>
                                                                                      1. Write SD File
<LinearLayout</pre>
                                                                                      2. Clear Screen
xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/widget28"
                                                                                      3. Read SD File
    android:padding="10dp"
                                                                                       4. Close File
    android:layout width="match parent"
    android:layout height="match parent"
                                                       <Button
    android:orientation="vertical" >
                                                             android:id="@+id/btnClearScreen"
                                                             android:layout width="160dp"
                                                             android:layout height="wrap content"
    <EditText
        android:id="@+id/txtData"
                                                             android:text="2. Clear Screen" />
        android:layout width="match parent"
        android:layout height="180dp"
                                                        < Button
        android:layout margin="10dp"
                                                            android:id="@+id/btnReadSDFile"
        android:background="#55dddddd"
                                                             android:layout width="160dp"
        android:padding="10dp"
                                                             android:layout height="wrap content"
        android:gravity="top"
                                                             android:text="3. Read SD File" />
        android:hint=
        "Enter some lines of data here..."
                                                        < Button
        android:textSize="18sp" />
                                                             android:id="@+id/btnFinish"
                                                             android:layout width="160dp"
    <Button
        android:id="@+id/btnWriteSDFile"
                                                             android:layout height="wrap content"
        android:layout width="160dp"
                                                             android:text="4. Finish App" />
        android:layout height="wrap content"
        android:text="1. Write SD File" />
                                                    </LinearLayout>
```

Example 3. Reading / Writing External SD Files

```
public class File3SdCard extends Activity {
  // GUI controls
  private EditText txtData;
  private Button btnWriteSDFile;
  private Button btnReadSDFile;
  private Button btnClearScreen;
  private Button btnClose;
  private String mySdPath;
  @Override
  public void onCreate(Bundle savedInstanceState) {
     super.onCreate(savedInstanceState);
     setContentView(R.layout.main);
     // find SD card absolute location
     mySdPath = Environment.getExternalStorageDirectory().getAbsolutePath();
     // bind GUI elements to local controls
     txtData = (EditText) findViewById(R.id.txtData);
     txtData.setHint("Enter some lines of data here...");
```

Example 3. Reading / Writing External SD Files

```
btnWriteSDFile = (Button) findViewById(R.id.btnWriteSDFile);
btnWriteSDFile.setOnClickListener(new OnClickListener() {
 @Override
 public void onClick(View v) {
   // WRITE on SD card file data taken from the text box
   try {
     File myFile = new File(mySdPath + "/mysdfile.txt");
     OutputStreamWriter myOutWriter = new OutputStreamWriter(
                                       new FileOutputStream(myFile));
     myOutWriter.append(txtData.getText());
     myOutWriter.close();
     Toast.makeText(getBaseContext(),
         "Done writing SD 'mysdfile.txt'",
         Toast.LENGTH SHORT).show();
   } catch (Exception e) {
     Toast.makeText(getBaseContext(), e.getMessage(),
         Toast.LENGTH SHORT).show();
 }// onClick
}); // btnWriteSDFile
```

Example 3. Reading / Writing External SD Files

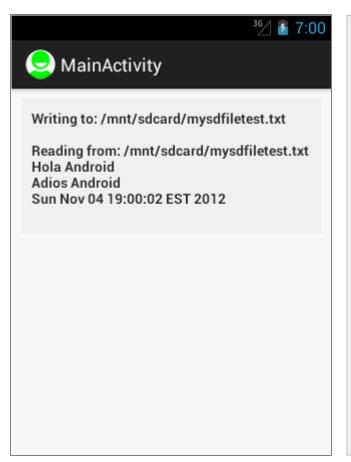

```
btnReadSDFile = (Button) findViewById(R.id.btnReadSDFile);
btnReadSDFile.setOnClickListener(new OnClickListener() {
 @Override
 public void onClick(View v) {
   // READ data from SD card show it in the text box
   try {
     BufferedReader myReader = new BufferedReader(
                                  new InputStreamReader(
                                  new FileInputStream(
                                  new File(mySdPath + "/mysdfile.txt"))));
     String aDataRow = "";
     String aBuffer = "";
     while ((aDataRow = myReader.readLine()) != null) {
       aBuffer += aDataRow + "\n";
     txtData.setText(aBuffer);
     myReader.close();
     Toast.makeText(getApplicationContext(),
         "Done reading SD 'mysdfile.txt'", Toast.LENGTH_SHORT).show();
   } catch (Exception e) {
     Toast.makeText(getApplicationContext(), e.getMessage(),
         Toast.LENGTH SHORT).show();
 }// onClick
}); // btnReadSDFile
                                                                              28
```

Example 3. Reading / Writing External SD Files

```
btnClearScreen = (Button) findViewById(R.id.btnClearScreen);
     btnClearScreen.setOnClickListener(new OnClickListener() {
        @Override
        public void onClick(View v) {
           // clear text box
           txtData.setText("");
     }): // btnClearScreen
     btnClose = (Button) findViewById(R.id.btnFinish);
     btnClose.setOnClickListener(new OnClickListener() {
        @Override
        public void onClick(View v) {
           // terminate app
           Toast.makeText(getApplicationContext(),
                 "Adios...", Toast.LENGTH_SHORT).show();
           finish();
     }); // btnClose
  }// onCreate
}// File3SdCard
```

Example 4. Using Scanner/PrintWriter on External SD Files 1 of 3

In this example we use the Scanner and PrintWriter classes. Scanners are useful for dissecting formatted input into simple **tokens**. Whitespace markers separate the tokens, which could be translated according to their data type.

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout</pre>
xmlns:android="http://schemas.android.com/apk/res/android"
    android:orientation="vertical"
    android:layout width="fill parent"
    android:layout height="fill parent"
    android:layout margin="10dp"
<TextView
    android:layout_width="fill parent"
    android:layout height="wrap content"
    android:padding="10dp"
    android:id="@+id/txtMsg"
    android:textStyle="bold"
    android:background="#77eeeeee"
</LinearLayout>
```

Example 4. Using Scanner/PrintWriter on External SD Files 2 of 3

```
public class File4Scanner extends Activity {
TextView txtMsg;
@Override
public void onCreate(Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);
    setContentView(R.layout.main);
    txtMsg = (TextView) findViewById(R.id.txtMsg);
    testScannedFile();
}//onCreate
```

```
private void testScannedFile(){
    try {
        String SDcardPath = Environment.getExternalStorageDirectory().getPath();
        String mySDFileName = SDcardPath + "/" + "mysdfiletest.txt";

        txtMsg.setText("Writing to: " + mySDFileName);
        // write to SD, needs "android.permission.WRITE_EXTERNAL_STORAGE"
        PrintWriter outfile= new PrintWriter( new FileWriter(mySDFileName) );

        outfile.println("Hola Android");
        outfile.println("Adios Android");
        outfile.println(new Date().toString());

        outfile.close();
```

Example 4. Using Scanner/PrintWriter on External SD Files 3 of 3

```
// read SD-file, show records.
  // needs permission "android.permission.READ EXTERNAL STORAGE"
        Scanner infile= new Scanner(new FileReader(mySDFileName));
        String inString= "\n\nReading from: " + mySDFileName + "\n";
        while(infile.hasNextLine()) {
           inString += infile.nextLine() + "\n";
        txtMsg.append(inString);
        infile.close();
     } catch (FileNotFoundException e) {
        txtMsg.setText( "Error: " + e.getMessage());
     } catch (IOException e) {
        txtMsg.setText( "Error: " + e.getMessage());
  }//testScannerFiles
}//class
```

Example 4. Comments

- You want to use the method
 Environment.getExternalStorageDirectory().getPath()
 to detemine the path to the external SD card.
- 2. A PrintWriter object is used to send data tokens to disk using any of the following methods: print(), println(), printf().
- A Scanner accepts whitespace separated tokens and converts then to their corresponding types using methods: next(), nextInt(), nextDouble(), etc.
